Sep 27, 2026

Meeting Sep 27, 2026 at 14:00 GMT+08:00

Meeting records Transcript

Summary

Tracking experiments and managing repositories with deploying applications.

Experiment tracking and reports
Weights and Biases project established for systematic model training metrics. Reports kept brief and high level for upcoming submission.

Repository and deployment strategy
GitHub organization repository created for document versioning. Hugging Face Spaces selected for application deployment via automated pipeline.

Pipeline and schedule alignment
Multimodal pipeline modified to process static images with audio. Next detailed planning session scheduled for Wednesday evening.

Decisions

Aligned

- **Weights and biases experiment tracking** The team agreed to adopt Weights & Biases as the standard tool for tracking training epochs, errors, losses, and accuracy metrics.

- **Proposal report flexibility and brevity** The team agreed to keep the upcoming proposal report as brief and model-agnostic as possible to maintain flexibility.
- **Dedicated GitHub organization for projects** The team agreed to create a separate GitHub organization to manage and track all project repositories for academic verification.
- **Hugging Face spaces application deployment** The team agreed to use Hugging Face spaces for deploying the project application.
- **Random frame video processing strategy** The team agreed to extract random video frames rather than a fixed first frame for processing in the audio-video pipeline.

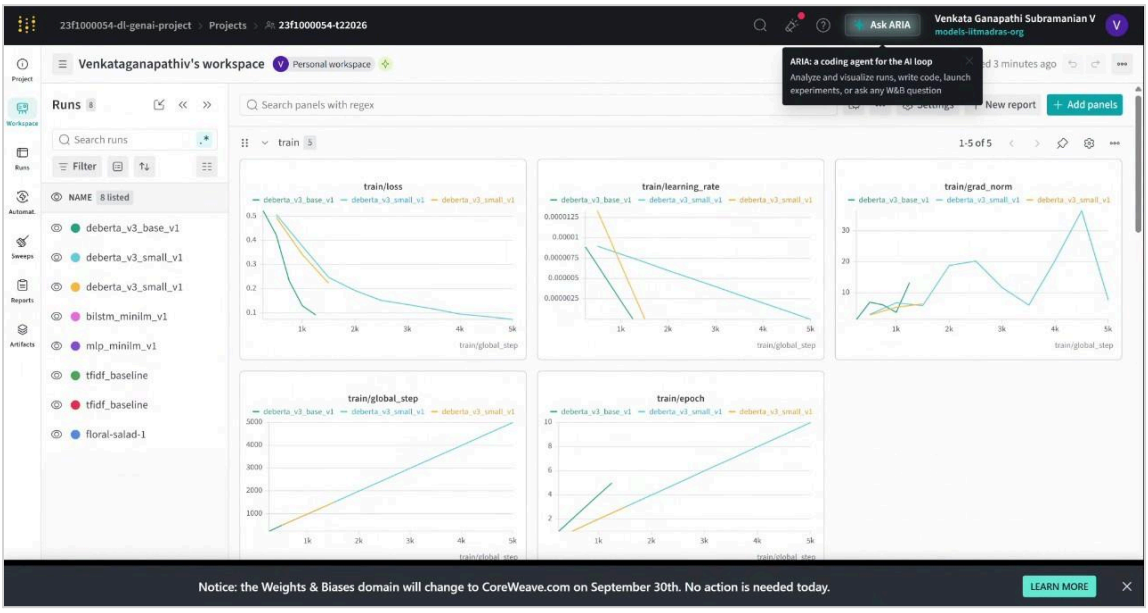

Next steps

- ☐ [Venkata Ganapathi Subramanian V] Share Project: Present the Weights and Biases project details to demonstrate tracking for epochs, errors, and losses.
- ☐ [s3arajgupta] Create Organization: Establish a GitHub organization to centralize project documentation and code repositories.
- ☐ [Ghanashyam] Share Dataset: Provide the link to the dataset required for the project.
- ☐ [Venkata Ganapathi Subramanian V] Send Email: Share email address to facilitate access to the project organization.
- ☐ [The group] Choose Project Name: Select an appropriate title from the proposed list to finalize the repository identity.
- ☐ [The group] Connect Hugging Face: Link the project organization to a Hugging Face account for future application deployment.
- ☐ [s3arajgupta] Grant Admin Access: Provide administrative privileges to team members for the project organization.
- ☐ [Venkata Ganapathi Subramanian V] Create Proposal Report: Draft a basic GC2 report in a Google Doc. Share the document with the team tonight with edit access enabled.

- [ ] [s3arajgupta] Manage Repository: Create a separate folder within the repository for the m files. Upload the relevant materials to this newly created directory.
- [ ] [Ghanashyam] Register NASA Apps: Complete the registration process for the NASA apps project. Join the team submission after registering.
- [ ] [The group] Discuss Submission: Meet on Wednesday evening to review and discuss the project proposal. Evaluate the submission plan for the upcoming deadline.
- [ ] [s3arajgupta] Engineering Features: Implement Hugging Space deployment for the application. Add support for processing audio and video image pipelines.
- [ ] [s3arajgupta] Share Ammo: Distribute the ammo resources to the team members.
- [ ] [The group] Explore AWS: Investigate the AWS Educate platform for potential benefits. Evaluate the platform features for team usage.

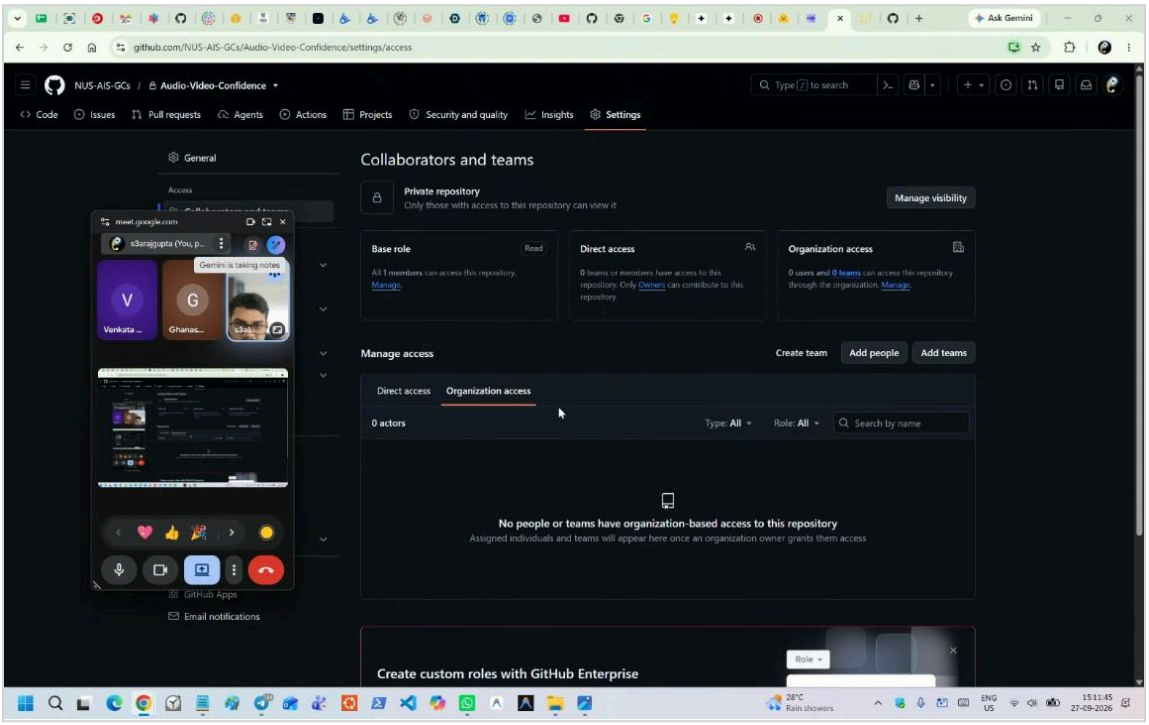

Details

- **Experiment Tracking via Weights & Biases**: Venkata Ganapathi Subramanian V proposed establishing a Weights & Biases project for all model training to systematically record training and validation metrics—including epochs, errors, losses, and accuracy—using structured tables and timestamps. Demonstrating a previous project, Venkata Ganapathi Subramanian V illustrated how the tool logs system architecture, folder structures, runtime data, GPU usage, and comparative graphs across model iterations, such as baseline models versus DeBERTa v3 (00:08:57). Venkata Ganapathi Subramanian V noted that integration requires importing the API into source code (e.g., Google Colab or local setups) to log metrics automatically, enabling the automated generation of comparative graphs for top-performing runs (00:09:46). s3arajgupta and Ghanashyam agreed with this approach, recognizing its value for project tracking and reproducibility (00:10:59).

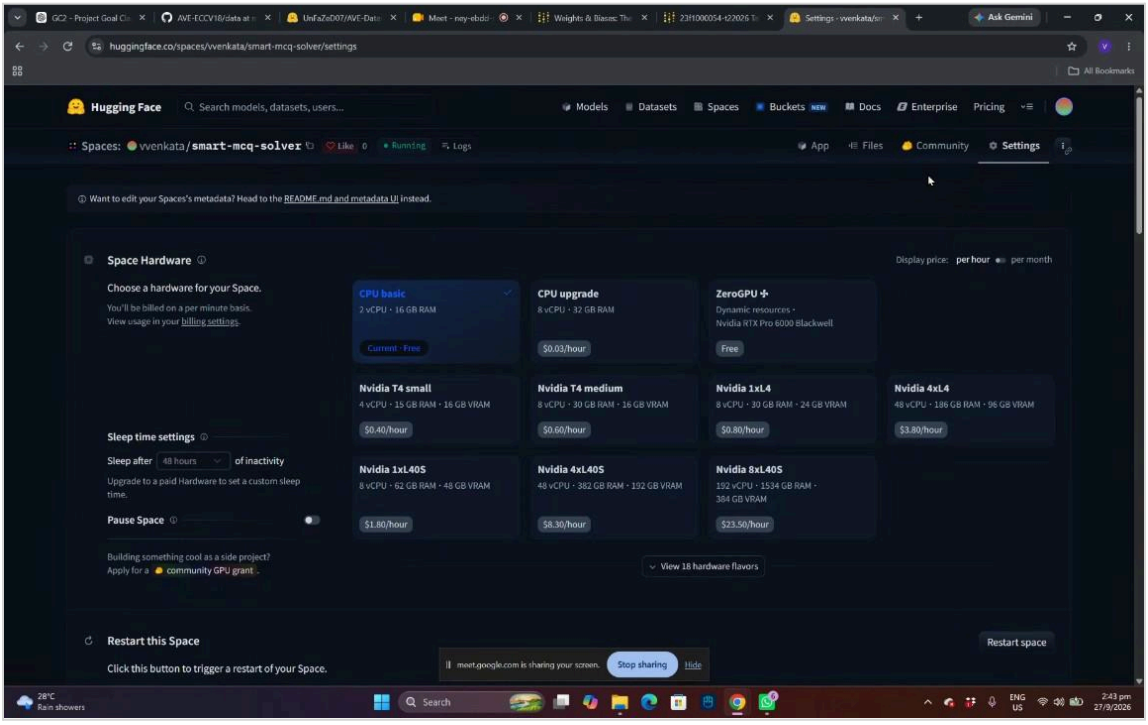

- **Report Writing Strategy & Bias Acknowledgment**: The team discussed biased outputs in generated draft reports, with Ghanashyam noting their report used Claude 3.5 (Opus/Pro) and Venkata Ganapathi Subramanian V using ChatGPT Pro, both of which reflected personal user biases and historical prompt requirements (00:02:09). Venkata Ganapathi Subramanian V explained that while Ghanashyam included specific aspirational models directly in their prompt, Venkata Ganapathi Subramanian V prefers starting with baseline models before selecting complex architectures (00:03:47). To maintain flexibility for their upcoming submission on the 30th, Venkata Ganapathi Subramanian V and s3arajgupta recommended keeping the official report brief, high-level, and free of specific model terms (like BERT+), allowing room to adjust models in the future based on performance metrics (00:04:36).
- **GitHub Organization & Document Versioning**: s3arajgupta suggested creating a shared GitHub repository to manage markdown versions of current proposals and future project documents, preventing confusion caused by localized, conflicting file versions (00:05:26). Following a discussion on whether to host the repository under a personal account or an organization, the team decided to form a dedicated organization for academic verification by university professors (00:07:48). s3arajgupta set up a private organization repository titled `NUS-AIS-GC2` (initially named `Avalidate` / `AV confidence`), and added Ghanashyam and Venkata Ganapathi Subramanian V (`MA083` /

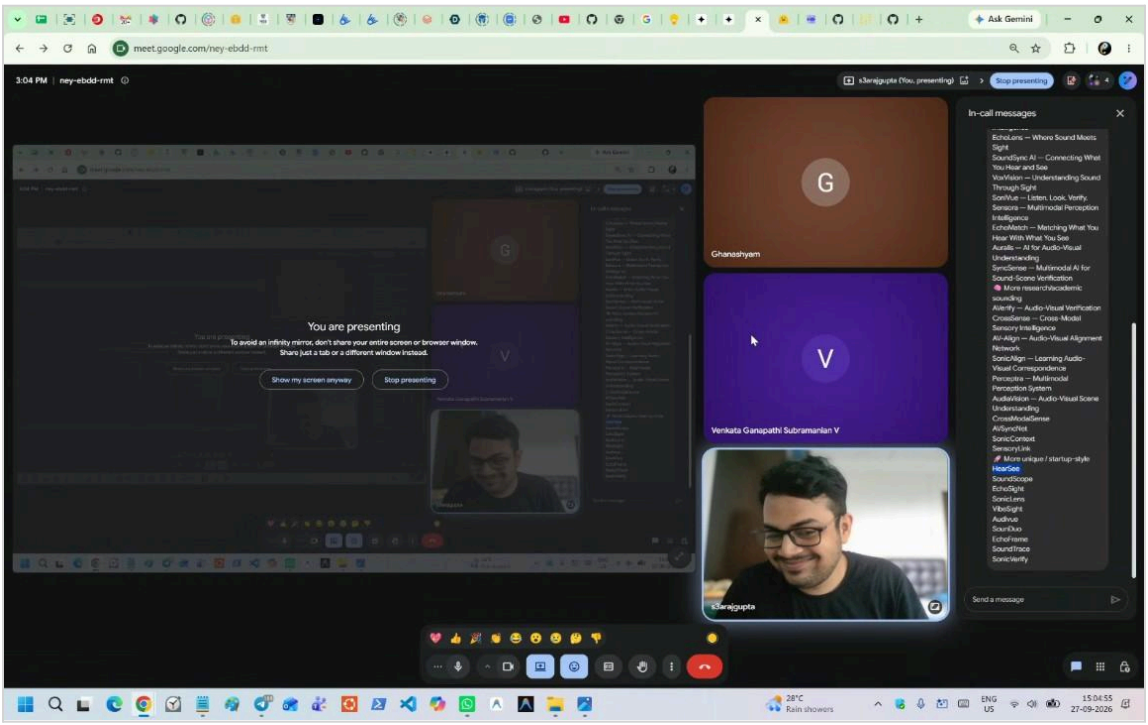

`VENKATA0803`) as collaborators with administrative access (00:27:12) (00:49:55).

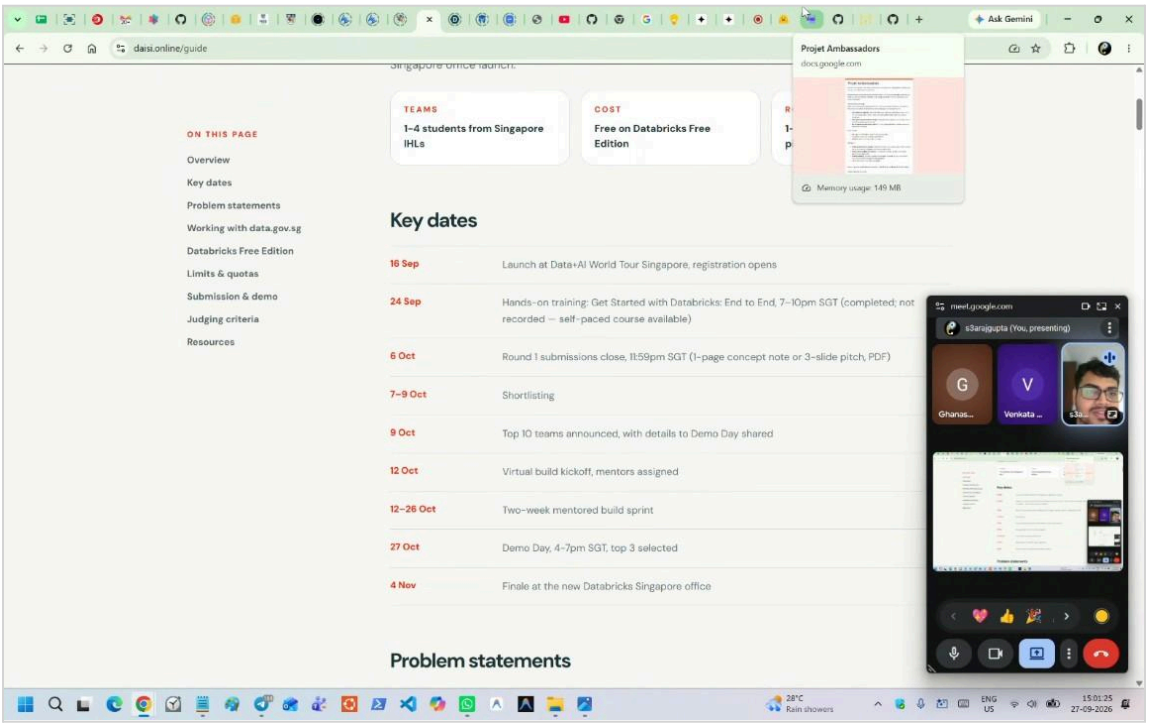

- **Deployment Strategy via Hugging Face Spaces**: Venkata Ganapathi Subramanian V demonstrated deploying applications using Hugging Face Spaces, sharing a project developed for an IIT Madras diploma program that achieved full marks (00:12:51) (00:16:55). Venkata Ganapathi Subramanian V explained that deploying via Gradio CPU ($9/month subscription) avoided debugging errors associated with Gradio Zero GPU setups and provided hosting without requiring external domain management tools like Ngrok, Streamlit, or Vercel (00:13:58) (00:18:13). The team agreed to host their app on Hugging Face Spaces, utilizing a GitHub integration pipeline where code commits automatically trigger builds (00:16:55). To optimize hosting costs, Venkata Ganapathi Subramanian V recommended putting the space to sleep when inactive and waking it up specifically during evaluations or presentations (00:22:55).

- **Netflix Regional Subscription Mechanics**: During a brief side conversation regarding subscription management, Venkata Ganapathi Subramanian V and Ghanashyam discussed Netflix's strict location validation policies. Venkata Ganapathi Subramanian V shared that using an Indian Netflix account while living in Singapore triggered a policy restricting out-of-country streaming to 14 days unless verified on the home network or transitioned to a local Singaporean subscription (00:14:48) (00:16:55). Ghanashyam noted that using a VPN connected to Indian servers allowed continuous streaming access without triggering regional lockouts (00:15:47).
- **Project Naming Brainstorming**: The participants discussed various project titles and repository names. Ghanashyam proposed names like "Averify", "SyncSense", and "Ventriloquist", referencing the ventriloquism effect where sound originates away from its visible source (00:28:19) (00:33:16). Venkata Ganapathi Subramanian V generated a list using ChatGPT, highlighting "VoxVision" and "SoundSync.ai", though existing domain overlaps were noted (00:36:32). s3arajgupta preferred functional options such as "AV confidence" or "Avalidate" (00:33:16). The team agreed to temporarily set the repository name as `Audio video confidential` and select a finalized, formal title at a later stage (00:49:55).

- **Competitions, Hackathons, and Skill Platforms**: s3arajgupta shared links to several upcoming events, encouraging participation in a project on Luma, the Databricks challenge, and the NASA Space Apps Challenge (noting a deadline reference of July 24th) (00:40:58). s3arajgupta requested that all team members register individually so they could form a unified submission group (00:41:50). Additionally, s3arajgupta referenced AWS Educate for training and shared that they were building a contact-tracking spreadsheet for job outreach, which Ghanashyam offered to exchange for streaming access (00:43:27).

- **Upcoming Schedule & Meeting Deadlines**: The team aligned their schedule around upcoming academic commitments, noting that Round 1 closes on October 6th and requires a three-slide pitch deck (00:40:58). Because Venkata Ganapathi Subramanian V has a presentation scheduled for Wednesday and several members needed time to complete individual assignments, the team agreed to conduct their next detailed planning session on Wednesday evening after completing the GC2 report (00:40:00).
- **Pipeline Redesign & Feature Engineering**: s3arajgupta outlined two architectural modifications for the project pipeline: integrating Hugging Face Spaces for deployment and adapting the multimodal pipeline to accept static images alongside audio rather than processing raw video continuously (00:47:26). Venkata Ganapathi Subramanian V pointed out that audio-video datasets (such as AV) often lack standalone image sets, making it necessary to extract individual frames directly from the source videos (00:48:49). To handle non-static video content effectively, s3arajgupta and Venkata Ganapathi Subramanian V agreed to engineer a feature that samples a single frame at random (or extracts the initial frame) combined with audio to generate a confidence score, alongside a secondary mode that computes an average across all video frames (00:47:26).

- **Administrative Wrap-Up & Proposal Deliverables**: To conclude the session, Venkata Ganapathi Subramanian V committed to drafting the baseline proposal in Google Docs by the end of the evening, deliberately incorporating flexible, high-level placeholders for the team to edit before final submission. s3arajgupta confirmed the repository initialization and committed to uploading current documentation files to a dedicated folder within the newly created GitHub repository (00:49:55).
